Hence, the correct option is (C).

1 PROBLEM

(GATE EC, Q. 25) A fair coin is tossed till a head appears for the first time. The probability that the number of required tosses is odd, is

- (A) $\frac{1}{3}$ (B) $\frac{1}{2}$ (C) $\frac{2}{3}$ (D) $\frac{3}{4}$

2 SOLUTION

Let $Y \in \mathbb{N}$ denote the number of times the experiment is performed. $Y = k$ represents $k - 1$ failures before getting 1 success. $p = \frac{1}{2}$

$$\therefore p_Y k = (1 - p)^k \times p \quad k \in \mathbb{N}$$

For getting first success on an odd try, $k = 2n + 1$. Let X be the Bernoulli Random Variable $X \sim B(1, 0)$. $X = 1$ denotes the outcome that odd number of tries are required to get the first head, $X = 0$ denotes all other outcomes.

$$\Pr(X = 1) = \sum_{n=0}^{\infty} p_Y(2n + 1) \quad (2.0.1)$$

$$\Pr(X = 1) = \sum_{n=0}^{\infty} (1 - p)^{(2n+1)-1} \times p \quad (2.0.2)$$

$$\Pr(X = 1) = \sum_{n=0}^{\infty} \left(\frac{1}{2}\right)^{2n} \times \frac{1}{2} \quad (2.0.3)$$

$$\Pr(X = 1) = \frac{\frac{1}{2}}{1 - \frac{1}{4}} \quad (2.0.4)$$

$$\therefore \Pr(X = 1) = \frac{2}{3} \quad (2.0.5)$$
