Hence, the correct option is (C).

1 PROBLEM

(GATE EC, Q. 25) A fair coin is tossed till a head appears for the first time. The probability that the number of required tosses is odd, is

- (A) $\frac{1}{3}$ (B) $\frac{1}{2}$ (C) $\frac{2}{3}$ (D) $\frac{3}{4}$

2 SOLUTION

Let $Y \in \mathbb{N}$ denotes the number of trials. $Y = k$ represents $k - 1$ failures before getting 1 success.
 $p = \frac{1}{2}$

$$\therefore p_Y(k) = (1 - p)^{k-1} \times p \quad (2.0.1)$$

Here, $k = 2n + 1$. Let X be the Bernoulli Random Variable $X \sim B(1, 0)$. The probability $p_Y(k)$ is mutually exclusive for all odd tries. Hence, by the rule of sum,

$$\Pr(X = 1) = \sum_{n=0}^{\infty} p_Y(2n + 1) \quad (2.0.2)$$

$$= \sum_{n=0}^{\infty} (1 - p)^{2n} \times p \quad (2.0.3)$$

$$= \frac{p}{1 - (p^2 - 2p + 1)} \quad (2.0.4)$$

$$= \frac{1}{2 - p} \quad (2.0.5)$$

$$\therefore \Pr(X = 1) = \frac{2}{3} \quad (2.0.6)$$
